# Discussion Session 7 

Sikun Lin
sikun@ucsb.edu

## Last time we covered ...

- Rendering Pipeline
- Modeling matrices
- Viewing matrix
- Projection matrix (\&transform into canonical view volume)
- Polygon clipping
- Depth test

## Today's Topic

- How to draw things onto pixels
- Line Drawing
- Scan conversion (both with codes samples)

## Line Drawing

- Bresenham's Line Algorithm
- Bresenham's Circle Algorithm

## Bresenham DDA Algorithm

- Developed by Jack E. Bresenham at IBM
- Ran on Calcomp plotter
- Based on the idea of Digital Difference Analyzer

## A DDA Line Drawing Function

```
Line(int x1, int y1, int x2, int y2){
    int dx = x1 - x2, dy = y2 - y1;
    int n = max(abs(dx),abs(dy));
    float dt = n, dxdt = dx/dt, dydt = dy/dt;
    float x = x1, y = y1;
    while (n--)
    {
        DrawPoint( round(x), round(y) );
        x += dxdt;
        y += dydt;
    }
}
What's bad about this?
```

## We can do better!

- Get rid of floating point operations
- The idea: chose the rights pixels from those next to the current pixel
- Assume: $d x>d y>0$

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

- Which of the green pixels is next?

## Key Idea

- We only ever go: right one pixel, or up and right one pixel ( $0<$ slope < 1). Call these choices "E" and "NE"
- Imagine pixels as "lattice points" on a grid
- Given next $X$ coordinate, we only need to chose between $y$ and $y+1$. ( $y$ is the $Y$ coordinate of the last pixel)

## The Midpoint Test

- Look at the vertical grid the line intersects
- On which side of the midpoint $(y+1 / 2)$ does the intersection lie?
- If it above the midpoint go NE, otherwise go $E$

## Our Example

## Implicit Functions

- Normally a line is defined as $y=m x+b$
- Instead, define $F(x, y)=a x+b y+c$, and let the line be everywhere $F(x, y)=0$
- Now if $F(x, y)>0$, we're "above" the line, and if $F(x, y)$ $<0$, we're "below" the line

## So what?

- We can evaluate the implicit line function at the midpoint to determine what to draw next!
- Even better, we can use the last function evaluation to find the next one cheaply!
- For any $x, y$ :

$$
\begin{aligned}
F(x+1, y)-F(x, y) & =a \\
F(x+1, y+1)-F(x, y) & =a+b
\end{aligned}
$$

## Midpoint Algorithm

```
Line(int x1, int y1, int x2, int y2){" "e" is the implicit
    int dx = x2 - x1, dy = y2 - y1;
int e = 2*dy - dx;
int incrE = 2*dy;
int incrNE = 2*(dy-dx);
int x = x1, y = y1;
DrawPoint( x, y );
while (x < x2){
        x++;
        if ( e <= 0 ) { e += incrE; }
        else { y++; e += incrNE; }
        DrawPoint( x, y );
    }
}
```

## Midpoint Algorithm for Circles

- Only consider the second octant (others are symmetric)
- Midpoint test still works: do we go right, or right and down?

## More Midpoint Circle Drawing

- The circle's implicit function (with radius r ):

$$
F(x, y)=x^{2}+y^{2}-r^{2}
$$

- Once we know the value of the implicit function at one midpoint we get the value at the next with the same differencing technique:
- If we're going $\mathrm{E}: ~ F(x+2, y)-F(x+1, y)=2 x+3$
- If we're going SE: $F(x+2, y-1)-F(x+1, y)=2(x-y)+5$

```
Drawing the 2 nd Ocatant
void Circle(int cx, int cy, int radius){
    int x = 0, y = radius, e = 1-radius;
    DrawPoint( x + cx, y + cy );
    while (y > x){
        if (e < 0) // Go "east"
        {
            e += 2*x + 3;
        }
        else // Go "south-east"
        {
            e +=2*(x-y)+5;
            y--;
        }
        x++;
        DrawPoint( x + cx, y + cy );
    }
```

    Final Circle Drawer
    void Circle(int cx, int cy, int radius){
int x = 0, y = radius, e = 1-radius;
int incrE = 3, incrSE = -2*radius + 5
DrawPoint( x + cx, y + cy );
while (y > x){
if (e < 0) // Go "east"
{
e += incrE;
incrE += 2; incrSE += 2;
} else // Go "south-east"
{
e += incrSE;
incrE += 2; incrSE += 4;
y--;
}
x++;
DrawPoint( x + cx, y + cy );
}
}

```

This looks pretty fast!

\section*{Scan Conversion}
- Figuring out which pixels to turn on

\section*{Scan Conversion}
- Render an image of a geometric primitive by setting pixel colors
```

void SetPixel(int x, int y, Color rgba)

```
- Example: Filling the inside of a triangle

\section*{Scan Conversion}
- Render an image of a geometric primitive by setting pixel colors
```

void SetPixel(int x, int y, Color rgba)

```
- Example: Filling the inside of a triangle

\section*{Triangle Scan Conversion}
- Properties of a good algorithm
- Symmetric
- Straight edges
- Antialiased edges
- No cracks between adiacent primitives
- MUST BE FAST!

\section*{Simple Algorithm}
- Color all pixels inside triangle
```

void ScanTriangle(Triangle T, Color rgba) {
for each pixel P at (x,y){
if (Inside(T, P))
SetPixel(x, y, rgba) ;
}
}

```

\section*{Line defines 2 half spaces}
- Implicit equation for a line
- On line: \(\quad a x+b y+c=0\)
- On right: \(\quad a x+b y+c<0\)
- On left: \(\quad a x+b y+c>0\)

\section*{Inside Triangle Test}
- A point is inside a triangle if it is in the positive halfspace of all three boundary lines
- Triangle vertices are ordered counter-clockwise
- Point must be on the left side of every boundary line

\section*{Inside Triangle Test}

Boolean Inside (Triangle T, Point P) \{
for each boundary line \(L\) of \(T\) \{ Scalar d = L.a*P.x + L.b*P.y + L.c; if (d \(<0.0\) ) return FALSE;
\}
return TRUE;
\}

\section*{Simple Algorithm}
- What's bad about this algorithm?
```

void ScanTriangle(Triangle T, Color rgba) {
for each pixel P at (x,y){
if (Inside(T, P))
SetPixel(x, y, rgba);
}
}

```

\section*{Triangle Sweep-Line Algorithm}
- Take advantage of spatial coherence
- Compute which pixels are inside using horizontal spans
, Process horizontal spans in scaline order
- Take advantage of edge linearity
- Use edges slopes to update coordinate incrementally

\section*{Triangle Sweep-Line Algorithm}
void ScanTriangle(Triangle T, Color rgba)\{
for each edge pair \{ initialize \(\mathrm{x}_{\mathrm{L}}, \mathrm{x}_{\mathrm{R}}\); compute \(d x_{L} / \mathrm{dy}_{\mathrm{L}}\) and \(\mathrm{dx}_{\mathrm{R}} / \mathrm{dy}_{\mathrm{R}}\); for each scanline at \(y\) for (int \(\mathrm{x}=\mathrm{x}_{\mathrm{L}} ; \mathrm{x}<=\mathrm{x}_{\mathrm{R}} ; \mathrm{x++}\) )

SetPixel(x, y, rgba);
\}
\}

\section*{Polygon Scan Conversion}
- Fill pixels inside a polygon
- Triangle
- Quadrilateral
- Convex
- Star-shaped
- Concave

- Self-intersecting
- Holes

What problems do we encounter with arbitrary polygons?

\section*{Polygon Scan Conversion}
- Need better test for points inside polygon
- Triangle method works only for convex polygons

Convex Polygon

Concave Polygon

\section*{Inside Polygon Rule}
- What's a good rule for which pixels are inside?

Concave

Self-Intersecting

With Holes

\section*{Inside Polygon Rule}
- Odd-parity rule
- Any ray from \(P\) to infinity cross an odd number of edges

Concave

Self-Intersecting

With Holes

\section*{That's what we discussed last time!}
- Scanline algorithm

\section*{Polygon Sweep-Line Algorithm}
- Incremental algorithm to find spans, and determine insideness with odd parity rule
- Takes advantage of scanline coherence

Triangle

Polygon

\section*{Polygon Sweep-Line Algorithm}
void ScanPolygon (Triangle T, Color rgba) \{
sort edges by maxy
make empty "active edge list"
for each scanline (top-to-bottom) \{
insert/remove edges from "active edge list" update \(x\) coordinate of every active edge
sort active edges by \(x\) coordinate
for each pair of active edges (left-to-right) SetPixels ( \(\mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{i}+1}, \mathrm{y}\), rgba) ;
\}
\}

\section*{Hardware Scan Convert}
- Turn everything into triangles!
- Scan convert Triangles

\section*{Hardware Antialiasing}
- Supersample pixels
- Multiple samples per pixel
- Average subpixel intensities (box filter)
- Trades intensity resolution for spatial resolution

Pixel with sampling positions

Sampled colours

Average \(=\) displayed colour

\section*{Q\&A}
